

Location.

Location.

Location.

It turns out that it's actually underground real estate where location" matters most. These days, locating cable or conduit in OSP can be a risky venture, but not with **DETECTABLE MULETAPE®** from Neptco.

The truth is, there's a lot of traffic down there — especially with the deregulation of the telecommunications industry and the explosive growth of the Internet. And where there's traffic, there's increased potential for accidents. But **DETECTABLE MULETAPE®** can take the guesswork out of questionable real estate.

With **MULETAPE** you can quickly locate empty duct and dielectric cables with ease. **MULETAPE** is a low stretch, high-strength woven tape, with a moisture- and corrosion-resistant copper conductor. It features an extrusion-friendly jacket

that's rated to withstand the intense heat created during the innerduct manufacturing process. And unlike traditional poly-rope, **DETECTABLE MULETAPE®** is pre-lubricated to reduce friction during cable pulls and thus avoid innerduct damage and burn through. All this translates into a pulling tape that maintains its integrity, long life, and most importantly, its performance.

DETECTABLE MULETAPE works at a wide range of frequencies and is compatible with any transmitter/receiving equipment. It can be spliced using conventional methods or using Neptco's famous **MULEKNOT®**. It's also available with accurate sequential footage or meter markings — so you can thread, measure and pull with the same product.

So whether it's long length, low frequency detection or precision locating in congested cable plants at high frequency, specify **DETECTABLE MULETAPE®**. Because location is everything.
